## OKAPI Browser Crack +

Provides a detailed list of available methods. Synopsis: Retrieves a list of methods available from an OKAPI server Input: Optional. A pointer to a server object. You must pass a pointer to a valid OKAPI server object. Output: A list of method description objects with additional information. If no objects were returned, the result list will be empty. Example: // OpenAPI source { "servers": [ { "url": "", "name": "OKAPI Demo Server" } ], "methods": [ { "url": "", "name": "get\_weather", "description": "Gets information about the current temperature. Parameters: - none Response: - responseType: { "format": "application/json" } - parameters: { "temperature": 80 }" }, { "url": "", "name": "get\_current\_observation", "description": "Gets the current observation for a given station. Parameters: - none" }, { "url": ""

## What's New in the?

----- OKAPI Browser is a comprehensive and easy to use application designed to help you browse and test OpenCaching API methods. OKAPI Browser downloads the list of available methods from the user-defined OKAPI server, allowing you to quickly access the method description. The basic functionality is: - define URL to OKAPI server and method, open OKAPI Browser for each method you defined - retrieve list of available methods - select a method to be tested - open method documentation - access the parameters to create your own test methods. All methods must be implemented by you.

OkapiCaching supports any method, by including the corresponding headers in the corresponding responses. For example, the header required to implement OpenCaching methods is: `` Cache-Control: public, max-age=900 `` That way you can test the required responses using any of the available methods. ----- License: MIT Copyright (c) 2013
